Manual on xml-mkiv page 22 on `\xmlchainatt` reads: returns the value of attribute NAME or empty if no such attribute exists; backtracks till a match is found

```
root: xmlatt <test> = <abc>
root: xmlchainatt <test> = <abc>
- node: xmlatt test = <pqr>
- node: xmlchainatt <node> = pqrabc
- node: xmlchainattdef <node> =
-- innernode: xmlatt test = <xyz>
-- innernode: xmlchainatt <test> = xyzpqrabc
```

However, does not stop when backtracking finds "a match".
